MONTE CARLO METHODS IN FINANCE

Don L. McLeish

September, 2003
# Contents

1 Introduction 1

2 Some Basic Theory of Finance. 9
   2.1 Introduction to Pricing: Single Period Models. .............. 9
   2.2 Multiperiod Models. ........................................ 15
   2.3 Determining the Process $B_t$. .................................. 21
   2.4 Minimum Variance Portfolios and the Capital Asset Pricing Model. 24
      2.4.1 The Capital Asset Pricing Model (CAPM) ............ 26
   2.5 Entropy: choosing a $Q$ measure ............................ 40
      2.5.1 Maximum Entropy ..................................... 40
      2.5.2 Minimum Cross-Entropy ............................... 44
      2.5.3 Cross Entropy ..................................... 45
   2.6 Models in Continuous Time .................................... 48
   2.7 Review Problems ............................................. 66

3 Basic Monte Carlo Methods 71
   3.1 Simulation and Monte Carlo Methods .......................... 71
   3.2 Uniform Random Number Generation ........................... 72
   3.3 Apparent Randomness of Pseudo-Random Number Generators .... 78
   3.4 Generating Random Numbers from Non-Uniform Continuous
      Distributions ............................................... 83
      3.4.1 The Acceptance-Rejection Method ........................ 88
      3.4.2 Application: A Discrete Time Black-Scholes Model .... 95
      3.4.3 Algorithms for Generating the Gamma and Beta Distributions ................................................. 98
      3.4.4 The Symmetric Stable Laws .............................. 108
      3.4.5 The Normal Inverse Gamma Distribution ............... 110
   3.5 Generating Random Numbers from Discrete Distributions .... 114
   3.6 Simulating Stochastic Partial Differential Equations ....... 121
   3.7 Problems .................................................. 126

4 Variance Reduction Techniques. 137
   4.1 Introduction .................................................. 137
   4.2 Variance reduction for one-dimensional Monte-Carlo Integration. 139
CONTENTS

4.3 Simulations from the Stationary Distribution of a Markov Chain. 166
4.4 Some Multivariate Applications in Finance. 169
  4.4.1 Asian Options. 169
  4.4.2 Use of Girsanov’s Lemma. 172
4.5 Simulating Barrier and lookback options 177
  4.5.1 Simulating the High and the Close 179
  4.5.2 One Factor, Two barriers 195
  4.5.3 Surviviorship Bias 201
4.6 Problems 204

5 Quasi-Monte Carlo Multiple Integration 209
  5.1 Introduction 209
  5.1.1 Errors in numerical Integration 211
  5.2 Theory of Low discrepancy sequences 213
    5.2.1 Definition: Measures of Discrepancy 214
  5.3 Examples of low discrepancy sequences 216
    5.3.1 Van der Corput Sequence 216
    5.3.2 The Halton Sequence 217
    5.3.3 Sobol Sequence 220
    5.3.4 Definition: elementary interval 221
    5.3.5 Definition: \((t,m,s)\) - net 221
    5.3.6 Definition: \((t,s)\) - sequence 221

6 Estimation and Calibration. 223
  6.1 Using Historical Data for Diffusion Models 223
  6.2 Estimating Volatility 225
  6.3 Estimating Hedge ratios and Correlation Coefficients 235
  6.4 Estimation using the Term Structure of Interest rates 241

7 Sensitivity Analysis, Estimating Derivatives and the Greeks. 243
  7.1 Estimating Derivatives 246
    7.1.1 The Score Function Estimator 247
    7.1.2 Example 250
    7.1.3 Example. Estimating Vega 250
    7.1.4 Gaussian Quadrature 251
  7.2 Infinitesimal Perturbation Analysis: Pathwise differentiation 253
    7.2.1 Example. IPA estimate of Vega 254
    7.2.2 Sensitivity of the value of a spread option to the correlation 257
  7.3 Problems 258

8 Miscellany 259
  8.1 Neural Nets 259
  8.2 Chaos, Long term dependence and non-linear Dynamics 260
  8.3 ARCH AND GARCH 260
    8.3.1 ARCH(1) 261
    8.3.2 Estimating Parameters 261
